

Universal Programmable Clock Generator (UPCG)

Features

- Integrated phase-locked loop (PLL)
- Field-Programmable
- Input frequency range:
 - Crystal: 8 MHz to 30 MHz
 - CLKIN: 1 MHz to 133 MHz
- Low-voltage complementary metal oxide semiconductor (LVCMOS) output frequency:
 - Up to 200 MHz (commercial grade)
 - Up to 166.6 MHz (industrial grade)
- Special Features:
 - Spread Spectrum
 - VCXO
 - Inputs: PD or OE, FS
- Low-jitter, high-accuracy outputs
- 3.3 V operation
- Commercial and industrial temperature ranges
- 8-pin small-outline integrated circuit (SOIC) package
- Serial interface for device configuration

Functional Description

The CY22801 is a flash-programmable clock generator that supports various applications in consumer and communications markets. The device uses the Cypress-proprietary PLL along with Spread Spectrum and VCXO technology to make it one of the most versatile clock synthesizers in the market. The device uses a Cypress-proprietary PLL to drive up to three configurable outputs in an 8-pin SOIC.

The CY22801 is programmed with an easy-to-use programmer dongle, the CY36800, in conjunction with the CyClocksRT™ software. This enables fast sample generation of prototype builds for user-defined frequencies. Cypress's value-added distribution partners and third-party programming systems from BP Microsystems, HiLo Systems, and others, can also be contacted for large production quantities. A JEDEC file needs to be configured to program CY22801, which can be generated using the CyClocksRT™ software.

Pin Definitions

| Name | Pin Number | Description |
|----------------------------|------------|--|
| CLKIN / XIN | 1 | External reference crystal input / external reference clock input |
| V _{DD} | 2 | 3.3 V voltage supply |
| SDAT/FS0 / VCXO / OE / PD# | 3 | Serial interface data line / frequency select 0 / VCXO analog control voltage / Output Enable / Power-down |
| V _{SS} | 4 | Ground |
| CLKB/FS1 / SCLK | 5 | Clock output B / frequency select 1 / serial interface clock line |
| CLKA | 6 | Clock output A |
| CLKC / FS2 | 7 | Clock output C / frequency select 3 / V _{SS} |
| XOUT | 8 | External reference crystal output: Connect to external crystal. When the reference is an external clock signal (applied to pin 1), this pin is not used and must be left floating. |

External Reference Crystal/Clock Input

CY22801 can accept external reference clock input as well as crystal input. External reference clock input frequency range is from 1 MHz to 133 MHz.

The input crystal oscillator of the CY22801 is an important feature because of the flexibility it provides in selecting a crystal as a reference clock source. The oscillator inverter has programmable gain, enabling maximum compatibility with a reference crystal, based on manufacturer, process, performance, and quality.

Input load capacitors are placed on the CY22801 die to reduce external component cost. These capacitors are true parallel-plate capacitors, designed to reduce the frequency shift that occurs when non-linear load capacitance is affected by load, bias, supply, and temperature changes.

The value of the input load capacitors is determined by eight bits in a programmable register. Total load capacitance is determined by the formula:

$$\text{CapLoad} = (C_L - C_{BRD} - C_{CHIP}) / 0.09375 \text{ pF}$$

In CyClocksRT, enter the crystal capacitance (C_L). The value of CapLoad is determined automatically and programmed into the CY22801.

Output Clock Frequencies

The CY22801 is a very flexible clock generator with up to three individual outputs, generated from an integrated PLL. See Figure 2 for details.

The output of the PLL runs at high frequency and is divided down to generate the output clocks. Two programmable dividers are available for this purpose. Therefore, although the output clocks may have different frequencies, they must be related, based on the PLL frequency.

It is also possible to direct the reference clock input to any of the outputs, thereby bypassing the PLL. Lastly, the reference clock may be passed through either divider.

Figure 2. Basic PLL Block Diagram

VCXO

One of the key components of the CY22801 device is the VCXO. The VCXO is used to 'pull' the reference crystal higher or lower to lock the system frequency to an external source. This is ideal for applications where the output frequency needs to track along with an external reference frequency that is constantly shifting.

A special pullable crystal must be used to have adequate VCXO pull range. Pullable crystal specifications are included in this data sheet.

VCXO is not compatible with Spread spectrum and Serial Interface.

VCXO Profile

Figure 3 shows an example of a VCXO profile. The analog voltage input is on the X-axis and the PPM range is on the Y-axis. An increase in the VCXO input voltage results in a corresponding increase in the output frequency. This moves the PPM from a negative to positive offset.

Figure 3. VCXO Profile

Spread Spectrum Clock Generation (SSCG)

Spread spectrum clock generation (SSCG) in CY22801 helps to reduce EMI found in today's high-speed digital electronic systems.

The device uses the proprietary spread spectrum clock (SSC) technology to synthesize and modulate the frequency of the input clock. By modulating the frequency of the clock, the measured EMI at the fundamental and harmonic frequencies is greatly reduced. This reduction in radiated energy can significantly reduce the cost of complying with the regulatory agency electromagnetic compatibility (EMC) requirements and improve time to market without degrading system performance.

Programmed spread spectrum modulation will appear same on all three clock outputs as they come from same PLL even if operating at different frequencies. Spread spectrum is not compatible with VCXO feature.

Spread Percentage

The percentage of spread can be programmed from ±0.25% to ±2.5% for center spread and from -0.5% to -5.0% for down spread. The granularity is 0.25%.

Modulation Frequency

The default modulation frequency is 31.5 kHz. Other modulation frequencies available through configuration software are 30.1 kHz and 32.9 kHz.

SSON Pin

SSON pin functionality can be used to turn Spread ON and OFF in clock output. Any one of the Multifunction pins can be configured as SSON pin.

Multifunction Pins

There are three pins ^[1] with multiple functions either as control pins or as output pins. The following are the acronyms used for the different control function pins:

- Output enable (OE): If OE = 1, all outputs are enabled
- Frequency select (FS0, 1, 2): These pins can be used to select one of the programmed clock frequencies for clock output. All of three multifunction pins support this functionality. Any of these pins can also be configured as Spread spectrum ON (SSON) pin. If SSON = 1, clock output has programmed spread; if SSON = 0, clock output does not have spread.
- Power-down: active low (PD#): If PD# = 0, all outputs are tristated and the device enters in the low-power state
- Voltage controlled crystal oscillator (VCXO): Analog voltage on this pin controls the output frequency of oscillator
- Serial interface clock line (SCLK) and serial interface data line (SDAT): These pins are for serial interface and are compatible with I²C.

Each of these three multi-function pins supports selected functions mentioned in Table 1. One of the supported functions can be programmed on the pin at a time.

Table 1. Multi Function Pin Options

| Pin# | Pin Name | OE | PD# | VCXO | FS | CLK OUTPUT | I ² C |
|------|------------------------------|----|-----|------------------|------------------|------------------|---------------------|
| 3 | SDAT / FS0 / VCXO / OE / PD# | Y | Y | Y ^[2] | Y ^[3] | N ^[4] | SDAT ^[2] |
| 5 | CLKB / FS1 / SCLK | N | N | N | Y | Y | SCLK |
| 7 | CLKC / FS2 | N | N | N | Y | Y ^[5] | N |

Table 2. Possible Combinations for Multifunction Pins

| Possible Combinations | Pin#3 | Pin#5 | Pin#7 |
|-----------------------|----------|-------|-------|
| A | FS0 | CLKB | CLKC |
| B | FS0 | CLKB | FS2 |
| C | FS0 | FS1 | FS2 |
| D | OE / PD# | CLKB | CLKC |
| E | OE / PD# | FS1 | CLKC |
| F | OE / PD# | FS1 | FS2 |
| G | SDAT | SCLK | CLKC |
| H | VCXO | CLKB | CLKC |

Frequency Calculation and Register Definitions

The CY22801 is an extremely flexible clock generator with four basic variables that are used to determine the final output frequency. They are the input reference frequency (REF), the internally calculated P and Q dividers, and the post divider, which can be a fixed or calculated value. There are three formulas to determine the final output frequency of a CY22801 based design:

■ $CLK = ((REF \times P) / Q) / \text{Post divider}$

■ $CLK = REF / \text{Post divider}$

■ $CLK = REF$

The basic PLL block diagram is shown in Figure 4. Each of the three clock outputs on the CY22801 has a total of seven output options available to it. There are six post divider options available: /2 (two of these), /3, /4, /DIV1N and /DIV2N. DIV1N and DIV2N are independently calculated and are applied to individual output groups. The post divider options can be applied to the calculated VCO frequency $((REF \times P) / Q)$ or to the REF directly.

In addition to the six post divider output options, the seventh option bypasses the PLL and passes the REF directly to the crosspoint switch matrix.

Notes

1. There are Weak Pull up resistors (approximately 100 kΩ) on all Multifunctional pins.
2. VCXO and SSON functions as well as VCXO and Serial Interface functions are not compatible.
3. 'Y' means pin supports this function.
4. 'N' means pin does not support this function.
5. Do not use this pin as Reference Clock Output.

Figure 4. Basic Block Diagram of CY22801 PLL

Default Startup Condition for the CY22801

The default (programmed) condition of the device is generally set by the distributor who programs the device using a customer specific JEDEC file produced by CyClocksRT™. Parts shipped from the factory are blank and unprogrammed. In this condition, all bits are set to 0, all outputs are three-stated, and the crystal oscillator circuit is active.

While you can develop your own subroutine to program any or all of the individual registers described in the following pages, it may be easier to use CyClocksRT to produce the required register setting file [6].

The serial interface address of the CY22801 is 69H. If there is a conflict with any other devices in your system, then this can also be changed [7][8].

Frequency Calculations and Register Definitions using the Serial (I²C) Interface

The CY22801 provides an industry standard serial interface for volatile, in-system programming of unique frequencies and options. Serial programming and reprogramming allows for quick design changes and product enhancements, eliminates inventory of old design parts, and simplifies manufacturing.

The I²C Interface provides volatile programming. This means when the target system is powered down, the CY22801 reverts to its pre-I²C state, as defined above (programmed or unprogrammed). When the system is powered back up again, the I²C registers must be reconfigured again.

All programmable registers in the CY22801 are addressed with eight bits and contain eight bits of data. The CY22801 is a slave device with an address of 1101001 (69H).

Table 3 lists the I²C registers and their definitions. Specific register definitions and their allowable values are listed as follows.

Reference Frequency

The REF can be a crystal or a driven frequency (CLKIN). For crystals, the frequency range must be between 8 MHz and 30 MHz. For a driven frequency, the frequency range must be between 1 MHz and 133 MHz.

Programmable Crystal Input Oscillator Gain Settings

The Input crystal oscillator gain (XDRV) is controlled by two bits in register 12H and are set according to Table 4 on page 8. The parameters controlling the gain are the crystal frequency, the internal crystal parasitic resistance (ESR, available from the manufacturer), and the CapLoad setting during crystal startup.

Bits 3 and 4 of register 12H control the input crystal oscillator gain setting. Bit 4 is the MSB of the setting, and bit 3 is the LSB. The setting is programmed according to Table 4 on page 8. All other bits in the register are reserved and should be programmed as shown in Table 5 on page 8.

FTAAddrSrc[1:0] bits set Frequency tuning array address source. This will be set by CyClockRT software based on selected configuration.

Notes

6. Advanced features like VCXO, SCL, SDA, FS, OE, SSON are not supported by CyClocksRT. Contact your local Cypress field application engineer for functional feasibility and custom configuration with these advanced features.
7. Please Contact your local Cypress FAE, if you need serial interface address other than 69H.
8. while configuring Jedec through CyClocksRT software, if Pin3 (SDAT) and Pin5 (SCLK) is not configured for any functionality, the jedec file automatically gets configured with I2C Enable Functionality with default I2C address as 69 H.

Using an External Clock as the Reference Input

The CY22801 also accepts an external clock as reference, with speeds up to 133 MHz. With an external clock, the XDRV (register 12H) bits must be set according to [Table 6 on page 8](#).

Table 3. Summary Table – CY22801 Programmable Registers

| Register | Description | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|----------|--|------------------|------------------|-------------|-------------|------------------|------------------|------------------|------------------|

Input Load Capacitors

$XCapSrc$ bit in 12H register selects the source of Input load capacitance. This will be set by CyClockRT software based on selected configuration.

Input load capacitors allow you to set the load capacitance of the CY22801 to match the input load capacitance from a crystal. The value of the input load capacitors is determined by 8 bits in a programmable register [13H]. Total load capacitance is determined by the formula:

$$CapLoad = (C_L - C_{BRD} - C_{CHIP}) / 0.09375 \text{ pF}$$

where:

- C_L = specified load capacitance of your crystal.
- C_{BRD} = the total board capacitance, due to external capacitors and board trace capacitance. In CyClocksRT, this value defaults to 2 pF.
- C_{CHIP} = 6 pF.
- 0.09375 pF = the step resolution available due to the 8-bit register.

In CyClocksRT, only the crystal capacitance (C_L) is specified. C_{CHIP} is set to 6 pF and C_{BRD} defaults to 2 pF. If your board capacitance is higher or lower than 2 pF, the formula given earlier is used to calculate a new CapLoad value and programmed into register 13H.

In CyClocksRT, enter the crystal capacitance (C_L). The value of CapLoad is determined automatically and programmed into the CY22801. Through the SDAT and SCLK pins, the value can be adjusted up or down if your board capacitance is greater or less than 2 pF. For an external clock source, CapLoad defaults to 0. See [Table 7 on page 9](#) for CapLoad bit locations and values.

The input load capacitors are placed on the CY22801 die to reduce external component cost. These capacitors are true parallel-plate capacitors, designed to reduce the frequency shift that occurs when nonlinear load capacitance is affected by load, bias, supply, and temperature changes.

PLL Frequency, Q Counter [42H(6..0)]

The first counter is known as the Q counter. The Q counter divides REF by its calculated value. Q is a 7 bit divider with a maximum value of 127 and minimum value of 0. The primary value of Q is determined by 7 bits in register 42H (6..0), but 2 is added to this register value to achieve the total Q, or Q_{total} . Q_{total} is defined by the formula:

$$Q_{total} = Q + 2$$

The minimum value of Q_{total} is 2. The maximum value of Q_{total} is 129. Register 42H is defined in the table.

Stable operation of the CY22801 cannot be guaranteed if REF/Q_{total} falls below 250 kHz. Q_{total} bit locations and values are defined in [Table 8 on page 9](#).

PLL Frequency, P Counter [40H(1..0)], [41H(7..0)], [42H(7)]

The next counter definition is the P (product) counter. The P counter is multiplied with the (REF/Q_{total}) value to achieve the VCO frequency. The product counter, defined as P_{total}, is made up of two internal variables, PB and PO. The formula for calculating P_{total} is:

$$P_{total} = (2(PB + 4) + PO)$$

PB is a 10-bit variable, defined by registers 40H(1:0) and 41H(7:0). The 2 LSBs of register 40H are the two MSBs of variable PB. Bits 4..2 of register 40H are used to determine the charge pump settings. The three MSBs of register 40H are preset and reserved and cannot be changed. PO is a single bit variable, defined in register 42H(7). This allows for odd numbers in P_{total}.

The remaining seven bits of 42H are used to define the Q counter, as shown in [Table 8](#).

The minimum value of P_{total} is 8. The maximum value of P_{total} is 2055. To achieve the minimum value of P_{total}, PB and PO should both be programmed to 0. To achieve the maximum value of P_{total}, PB should be programmed to 1023, and PO should be programmed to 1.

Stable operation of the CY22801 cannot be guaranteed if the value of (P_{total} × (REF/Q_{total})) is above 400 MHz or below 100 MHz.

PLL Post Divider Options [0CH(7..0)], [47H(7..0)]

The output of the VCO is routed through two independent muxes, then to two divider banks to determine the final clock

output frequency. The mux determines if the clock signal feeding into the divider banks is the calculated VCO frequency or REF. There are two select muxes (DIV1SRC and DIV2SRC) and two divider banks (Divider Bank 1 and Divider Bank 2) used to determine this clock signal. The clock signal passing through DIV1SRC and DIV2SRC is referred to as DIV1CLK and DIV2CLK, respectively.

The divider banks have four unique divider options available: /2, /3, /4, and /DIVxN. DIVxN is a variable that can be independently programmed (DIV1N and DIV2N) for each of the two divider banks. The minimum value of DIVxN is 4. The maximum value of DIVxN is 127. A value of DIVxN below 4 is not guaranteed to work properly.

DIV1SRC is a single bit variable, controlled by register 0CH. The remaining seven bits of register 0CH determine the value of post divider DIV1N.

DIV2SRC is a single bit variable, controlled by register 47H. The remaining seven bits of register 47H determine the value of post divider DIV2N.

Register 0CH and 47H are defined in [Table 9](#).

Charge Pump Settings [40H(2..0)]

The correct pump setting is important for PLL stability. Charge pump settings are controlled by bits (4..2) of register 40H, and are dependent on internal variable PB (see “PLL Frequency, P Counter[40H(1..0)], [41H(7..0)], [42H(7)]”). [Table 10 on page 10](#) summarizes the proper charge pump settings, based on Ptotal.

See [Table 11 on page 10](#) for register 40H bit locations and values.

Table 10. Charge Pump Settings

| Charge Pump Setting – Pump(2..0) | Calculated P _{total} |
|----------------------------------|--------------------------------------|
| 000 | 16–44 |
| 001 | 45–479 |
| 010 | 480–639 |
| 011 | 640–799 |
| 100 | 800–1023 |
| 101, 110, 111 | Do not use – device will be unstable |

Table 11. Register 40H Change Pump Bit Settings

| Address | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|---------|----|----|----|---------|---------|---------|-------|-------|
| 40H | 1 | 1 | 0 | Pump(2) | Pump(1) | Pump(0) | PB(9) | PB(8) |

Although using the above table guarantees stability, it is recommended to use the Print preview function in CyClocksRT to determine the correct charge pump settings for optimal jitter performance.

PLL stability cannot be guaranteed for values below 16 and above 1023. If values above 1023 are needed, use CyClocksRT to determine the best charge pump setting. To configure device using serial interface, please refer CyClocksRT.

Clock Output Settings: CLKSRC – Clock Output Crosspoint Switch Matrix [44H(7..0)], [45H(7..0)], [46H(7..6)]

Every clock output can be defined to come from one of seven unique frequency sources. The CLKSRC(2..0) crosspoint switch matrix defines which source is attached to each individual clock output. CLKSRC(2..0) is set in Registers 44H, 45H, and 46H. The remainder of register 46H(5:0) must be written with the values stated in the register table when writing register values 46H(7:6).

When DIV1N is divisible by four, then CLKSRC(0,1,0) is guaranteed to be rising edge phase-aligned with CLKSRC(0,0,1). When DIV1N is six, then CLKSRC(0,1,1) is

guaranteed to be rising edge phase-aligned with CLKSRC(0,0,1).

When DIV2N is divisible by four, then CLKSRC(1,0,1) is guaranteed to be rising edge phase-aligned with CLKSRC(1,0,0). When DIV2N is divisible by eight, then CLKSRC(1,1,0) is guaranteed to be rising edge phase-aligned with CLKSRC(1,0,0).

CLKOE – Clock Output Enable Control [09H(5..0)]

Each clock output has its own output enable, controlled by register 09H(5..0). To enable an output, set the corresponding CLKOE bit to 1. CLKOE settings are in [Table 14 on page 11](#).

Test, Reserved, and Blank Registers

Writing to any of the following registers causes the part to exhibit abnormal behavior, as follows.

- [00H to 08H] – Reserved
- [0AH to 0BH] – Reserved

Application Guideline

Best Practices for Best Jitter Performance

Jitter can be specified in different terminologies:

Time Domain:

- Cycle-to-cycle jitter
- Period jitter
- Long-term jitter

Frequency domain:

- Deterministic jitter
- Random jitter
- Phase noise

These jitter terms are usually given in terms of root mean square (RMS), peak-to-peak, or in the case of phase noise, dBc/Hz with respect to fundamental frequency. Cycle-to-cycle and period jitter are generally used terminologies. Jitter depends on many factors and few of the them can be controlled in application:

- Input reference jitter
- Number of active clock outputs
- Operating temperature
- Clock output load
- PLL frequencies
- Termination and layout
- Supply voltage accuracy

Jitter is directly proportional to the input reference jitter, number of active clock outputs, operating temperature and clock output load, but inversely proportional to the PLL frequency. Best practices for termination, layout and supply voltage filtering are discussed in application note “Layout and Termination Techniques For Cypress Clock Generators – AN1111”.

Possible Configuration Examples

Table 15. Possible Configuration

| Possible Configurations | Pin#1 | Pin#3 | Pin#5 | Pin#6 | Pin#7 | Pin#8 |
|-------------------------|------------------------|-------|--------------|--|-------|-------------------------|
| A | CLKIN: 33 MHz | OE | CLKB: 33 MHz | CLKA: 100 MHz with +/-1% Spread | SSON | NC |
| B | XIN: 27 MHz crystal | VCXO | PD# | CLKA: 74.25 / 74.175824 MHz | FS2 | XOUT: 27 MHz crystal |
| C | CLKIN: 10 MHz | OE | FS1 | CLKA: 25 / 40 / 33.3333 / 50 MHz | FS2 | NC |
| D | CLKIN: 10 MHz | SDAT | SCLK | CLKA | CLKB | NC |

Contact your local Cypress field application engineer for functional feasibility and custom configuration with these advanced features.

Field Programming the CY22801

The CY22801 is programmed using the CY36800 USB programmer dongle. The CY22801 is flash-technology based, so the parts are reprogrammed up to 100 times. This enables fast and easy design changes and product updates, and eliminates any issues with old and out-of-date inventory.

Samples and small prototype quantities are programmed using the CY36800 programmer. Cypress’s value-added distribution partners and third-party programming systems from BP Microsystems, HiLo Systems, and others, can also be contacted for large production quantities. Third-Party Programmer List can be found at below link <http://www.cypress.com/?riD=14364>.

CyClocksRT Software

CyClocksRT is an easy-to-use software application that enables the user to custom-configure the CY22801. Users can specify the XIN/CLKIN frequency, crystal load capacitance, and output frequencies. CyClocksRT then creates an industry-standard JEDEC file that is used to program the CY22801^[6].

When needed, an advanced mode is available that enables users to override the automatically generated voltage controlled oscillator (VCO) frequency and output divider values.

CyClocksRT is a component of the CyberClocks™ software that you can download free of charge from the Cypress website at <http://www.cypress.com>.

CY36800 InstaClock™ Kit

The Cypress CY36800 InstaClock kit comes with everything needed to design the CY22801 and program samples and small prototype quantities. The CyClocksRT software is used to quickly create a JEDEC programming file, which is then downloaded directly to the portable programmer that is included in the CY36800 InstaClock kit. The JEDEC file can also be saved for use in a production programming system for larger volumes.

The CY36800 also comes with five samples of the CY22801, which are programmed with preconfigured JEDEC files using the InstaClock software.

Informational Graphs

The informational graphs are meant to convey the typical performance levels. No performance specifications is implied or guaranteed.

Absolute Maximum Conditions

| Parameter | Description | Min | Max | Unit |
|-----------------|---|-----------------------|-----------------------|------|
| V _{DD} | Supply voltage | -0.5 | 4.6 | V |
| T _S | Storage temperature | -65 | 150 | °C |
| T _J | Junction temperature | - | 125 | °C |
| V _{IO} | Input and output voltage | V _{SS} - 0.5 | V _{DD} + 0.5 | V |
| ESD | Electrostatic discharge voltage per MIL-STD-883C, Method 3015 | 2000 | - | V |

Recommended Operating Conditions

| Parameter | Description | Min | Typ | Max | Unit |
|-------------------|--|------|-----|------|------|
| V _{DD} | Operating voltage | 3.14 | 3.3 | 3.47 | V |
| T _A | Ambient temperature, commercial grade | 0 | - | 70 | °C |
| | Ambient temperature, industrial grade | -40 | -- | 85 | °C |
| C _{LOAD} | Maximum load capacitance on the CLK output | - | - | 15 | pF |
| t _{PU} | Power-up time for V _{DD} to reach the minimum specified voltage (power ramps must be monotonic) | 0.05 | - | 500 | ms |

Recommended Crystal Specifications for non-VCXO Applications

| Parameter | Name | Description | Min | Typ | Max | Unit |
|-------------------|------------------------------------|--|-----|-----|-----|------|
| F _{NOM} | Nominal crystal frequency | Parallel resonance, fundamental mode, and AT cut | 8 | - | 30 | MHz |
| C _{LNOM} | Nominal load capacitance | | 6 | - | 30 | pF |
| R ₁ | Equivalent series resistance (ESR) | Fundamental mode | - | 35 | 50 | Ω |
| DL | Crystal drive level | No external series resistor assumed | - | 0.5 | 2 | mW |

Pullable Crystal Specifications for VCXO Application only

| Parameter ^[9] | Name | Min | Typ | Max | Unit |
|--------------------------------|--|------|-----|------|------|
| C _{LNOM} | Crystal load capacitance | - | 14 | - | pF |
| R ₁ | Equivalent series resistance | - | - | 25 | Ω |
| R ₃ /R ₁ | Ratio of third overtone mode ESR to fundamental mode ESR. Ratio is used because typical R ₁ values are much less than the maximum spec. | 3 | - | - | - |
| DL | Crystal drive level. No external series resistor assumed | - | 0.5 | 2 | mW |
| F _{3SEPHI} | Third overtone separation from 3 × F _{NOM} (high side) | 300 | - | - | ppm |
| F _{3SEPLO} | Third overtone separation from 3 × F _{NOM} (low side) | - | - | -150 | ppm |
| C ₀ | Crystal shunt capacitance | | | 7 | pF |
| C ₀ /C ₁ | Ratio of shunt to motional capacitance | 180 | - | 250 | |
| C ₁ | Crystal motional capacitance | 14.4 | 18 | 21.6 | fF |

Note

9. Crystals that meet this specification include Ecliptek ECX-5788-13.500M, Siward XTL001050A-13.5-14-400, Raltron A-13.500-14-CL, and PDI HA13500XFA14XC.

DC Electrical Specifications

| Parameter ^[10] | Name | Description | Min | Typ | Max | Unit |
|---------------------------|-------------------------|---|---------------------|-----|---------------------|---------|
| I_{OH} | Output high current | $V_{OH} = V_{DD} - 0.5$, $V_{DD} = 3.3$ V (source) | 12 | 24 | – | mA |
| I_{OL} | Output low current | $V_{OL} = 0.5$, $V_{DD} = 3.3$ V (sink) | 12 | 24 | – | mA |
| C_{IN1} | Input capacitance | All input pins except XIN and XOUT | – | – | 7 | pF |
| C_{IN2} | Input capacitance | XIN and XOUT pins for non-VCXO applications | – | 24 | – | pF |
| I_{IH} | Input high current | $V_{IH} = V_{DD}$ | – | 5 | 10 | μ A |
| I_{IL} | Input low current | $V_{IL} = 0$ V | – | – | 50 | μ A |
| $f_{\Delta XO}$ | VCXO pullability range | Using crystal in this data sheet | ± 150 | – | – | ppm |
| V_{VCXO} | VCXO input range | | 0 | – | V_{DD} | V |
| V_{IH} | Input high voltage | CMOS levels, 70% of V_{DD} | $0.7 \times V_{DD}$ | – | – | V |
| V_{IL} | Input low voltage | CMOS levels, 30% of V_{DD} | – | – | $0.3 \times V_{DD}$ | V |
| $I_{DD}^{[11]}$ | V_{DD} supply current | All three clock outputs are at 100 MHz | – | 30 | – | mA |

Notes

10. Not 100% tested, guaranteed by design.

11. Power supply current is configuration dependent. Use CyClocksRT to calculate actual I_{DD} for specific output frequency configurations.

AC Electrical Characteristics

| Parameter ^[12] | Name | Description | Min | Typ | Max | Unit |
|----------------------------------|--------------------------------------|---|------|------|-------|------|
| f _{REFC} | Reference frequency - crystal | | 8 | – | 30 | MHz |
| f _{REFD} | Reference frequency - driven | | 1 | – | 133 | MHz |
| f _{OUT} | Output frequency, commercial grade | | – | – | 200 | MHz |
| | Output frequency, industrial grade | | – | – | 166.6 | MHz |
| DC | Output duty cycle | 50% of V _{DD} , see Figure 6 | 45 | 50 | 55 | % |
| t ₃ | Rising edge slew rate | Output clock rise time, 20%–80% of V _{DD} , see Figure 7 | 0.8 | 1.4 | – | V/ns |
| t ₄ | Falling edge slew rate | Output clock fall time, 80%–20% of V _{DD} , see Figure 7 | 0.8 | 1.4 | – | V/ns |
| t ₅ ^[13] | Skew | Output-output skew between related outputs, see Figure 9 | – | – | 250 | ps |
| t ₆ ^[14] | Clock jitter | Peak-to-peak period jitter, see Figure 8 | – | 250 | – | ps |
| t _{CCJ} ^[14] | Cycle-to-cycle jitter CLKA/B/C | XIN = CLKA/B/C = 166 MHz, ±2% spread and No REFOUT, V _{DD} = 3.3 V, see Figure 10 | – | – | 110 | ps |
| | | XIN = CLKA/B/C = 66.66 MHz, ±2% spread and No REFOUT, V _{DD} = 3.3 V, see Figure 10 | – | – | 170 | ps |
| | | XIN = CLKA/B/C = 33.33 MHz, ±2% spread and No REFOUT, V _{DD} = 3.3 V, see Figure 10 | – | – | 140 | ps |
| | | XIN = CLKA/B/C = 14.318 MHz, ±2% spread and No REFOUT, V _{DD} = 3.3 V, see Figure 10 | – | – | 290 | ps |
| t _{PD} | Power-down time | Time from falling edge on PD# pin to tristated outputs (asynchronous), see Figure 11 | – | 150 | 300 | ns |
| t _{OE1} | Output disable time | Time from falling edge on OE pin to tristated outputs (asynchronous), see Figure 12 | – | 150 | 300 | ns |
| t _{OE2} | Output enable time | Time from rising edge on OE pin to valid clock outputs (asynchronous), see Figure 12 | – | 150 | 300 | ns |
| F _{MOD} | Spread spectrum modulation frequency | | 30.1 | 31.5 | 32.9 | kHz |
| t ₁₀ | PLL lock time | | – | – | 3 | ms |

Notes

12. Not 100% tested, guaranteed by design.

13. Skew value guaranteed when outputs are generated from the same divider bank.

14. Jitter measurement may vary. Actual jitter is dependent on input jitter and edge rate, number of active outputs, input and output frequencies, supply voltage, temperature, and output load.

2-wire Serial (I²C) Interface Timing

When using I²C interface, the CY22801 should be programmed as I²C-capable prior to using this interface.

The CY22801 uses a 2-wire serial-interface SDAT and SCLK that operates up to 400 kbits/second in read or write mode. The basic write serial format is as follows.

Start Bit; seven-bit Device Address (DA); R/W Bit; Slave Clock Acknowledge (ACK); eight-bit Memory Address (MA); ACK; eight-bit data; ACK; eight-bit data in MA + 1 if desired; ACK; eight-bit data in MA+2; ACK; and so on, until STOP bit. The basic serial format is illustrated in Figure 14.

Data Valid

Data is valid when the Clock is HIGH, and may only be transitional when the clock is LOW, as illustrated in Figure 13.

Data Frame

Every new data frame is indicated by a start and stop sequence, as illustrated in Figure 15.

Start Sequence – Start frame is indicated by SDAT going LOW when SCLK is HIGH. Every time a Start signal is given, the next eight-bit data must be the device address (seven bits) and a R/W bit, followed by the register address (eight bits) and register data (eight bits).

Stop Sequence – Stop frame is indicated by SDAT going HIGH when SCLK is HIGH. A Stop frame frees the bus for writing to another part on the same bus or writing to another random register address.

Acknowledge Pulse

During Write mode, the CY22801 responds with an ACK pulse after every eight bits. This is accomplished by pulling the SDAT line LOW during the N × 9th clock cycle, as illustrated in Figure 16. (N = the number of eight-bit segments transmitted.) During Read mode, the ACK pulse, after the data packet is sent, is generated by the master.

Table 16. Serial Programming Interface Timing Specifications

| Parameter | Description | Min | Max | Unit |
|--------------|---|-----|-----|---------|
| f_{SCLK} | Frequency of SCLK | – | 400 | kHz |
| $t_{HD:STA}$ | Hold time START condition | 0.6 | – | μ s |
| t_{LOW} | Low period of the SCLK clock | 1.3 | – | μ s |
| t_{HIGH} | High period of the SCLK clock | 0.6 | – | μ s |
| $t_{SU:STA}$ | Setup time for a repeated START condition | 0.6 | – | μ s |
| $t_{HD:DAT}$ | Data hold time | 100 | – | ns |
| $t_{SU:DAT}$ | Data setup time | 100 | – | ns |
| t_R | Rise time | – | 300 | ns |
| t_F | Fall time | – | 300 | ns |
| $t_{SU:STO}$ | Setup time for STOP condition | 0.6 | – | μ s |
| t_{BUf} | Bus-free time between STOP and START conditions | 1.3 | – | μ s |

Ordering Information

| Ordering Code | Package Type | Operating Range | Operating Voltage |
|---------------|----------------------------|-----------------------------|-------------------|
| CY22801KFXC | 8-pin SOIC | Commercial, 0 °C to 70 °C | 3.3 V |
| CY22801KFXCT | 8-pin SOIC – Tape and Reel | Commercial, 0 °C to 70 °C | 3.3 V |
| CY22801KFXI | 8-pin SOIC | Industrial, –40 °C to 85 °C | 3.3 V |
| CY22801KFXIT | 8-pin SOIC – Tape and Reel | Industrial, –40 °C to 85 °C | 3.3 V |

Some product offerings are factory-programmed customer-specific devices with customized part numbers. The [Possible Configurations](#) table shows the available device types, but not complete part numbers. Contact your local Cypress FAE or sales representative for more information.

Possible Configurations

| Ordering Code | Package Type | Operating Range | Operating Voltage |
|----------------------------------|----------------------------|-----------------------------|-------------------|
| CY22801SXC-xxx ^[15] | 8-pin SOIC | Commercial, 0 °C to 70 °C | 3.3 V |

© Cypress Semiconductor Corporation, 2007-2015. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
